Familiarity with resilient energy systems, including the design and operation of microgrids, energy hubs, and multi-energy systems. Enter an email to receive alerts for microgrids positions.

Hence, this dissertation addresses these issues by proposing new device-level control algorithms for IBRs, deriving analytical stability criteria, and integrating device-level controller design into the grid ...

In this thesis, the main goal of the secondary controllers is augmented with one of the following additional objectives: (i) achieving active power consensus between ac-DGs and dc-DGs (and ICs), ...

The PhD candidate will analyse advanced control strategies for DC microgrid power balancing, including household level and study the role of the control architecture.

Our research team is composed of a diverse group, including Postdoctoral Fellows, PhD students, Research Associates, Research Engineers, and final year project students (M.Engg, M.Sc & B.Tech).

Research in the field of DC microgrids spans across a broad range of topics, ranging from control algorithms to improve load sharing between converters within the DC microgrid, energy ...

Hybrid DC/AC microgrid systems represent a significant advancement in power distribution technology, combining the benefits of both AC and DC power systems while addressing the growing need for ...

A Microgrid can operate autonomously or interact with the main grid, featuring distributed energy resources, power electronic converters, and local ...

Advancements in control strategies and modelling techniques are thus essential to address these challenges [3-4]. The proposed PhD thesis aims to tackle these challenges by developing advanced ...

Applicants for PhD must hold an undergraduate degree at 2.1 level and a master's degree. Alternatively,

Microgrid PhD Treatment

applicants with a UK first class honours degree (or non-UK equivalent as defined by Swansea ...
