When you series, the voltage adds and the current is the lesser of any in the string. When you parallel, the current adds but is no more than the least of the string.

I have a situation where I have an uneven number of pv modules that I wish to connect to a single MPPT charge controller. In a single series they exceed the rated power of a given MPPT ...

For many new to photovoltaic system design, determining the maximum number of modules per series string can seem straight forward, right? Simply divide the ...

Will an MPPT function correctly if you put two sets of parallel panels (2P and 3P) in series, where one "string" is just higher current than the other? I realize this is the reverse of the way ...

To avoid this and to ensure that all generated energy is used, we recommend a two-string design. Alternatively, if a single string design is necessary, the mySolarEdge app allows configuring manual ...

It does however leave a spare MPPT so you have the option to buy some extra panels and add a second string of at least 3 panels into the second MPPT. The second string can face a ...

In order to solve the problems of complex arrangement leads and uneven light transmission of components in the prior art, the utility model provides an odd-numbered string photovoltaic...

When you decide how many photovoltaic strings to connect, you need to look at several key factors. These include the number of input ports, the voltage and current ratings, and the safety codes that ...

Like the others have said, don't parallel two different length strings. If you try to parallel different strings the Inverter (MPPT) cannot track the optimum voltage (V_{mp}) of either string and the ...

Odd number of photovoltaic panel strings

The primary goal of string sizing calculations is determining the minimum and maximum number of modules per string the inverter can handle. ...
