The hypothetical starship Chrysalis--designed to carry up to 2,400 people on a centuries-long voyage to Proxima Centauri b--just won first place in ...

Proxima Centauri b is a super Earth exoplanet that orbits a M-type star. Its mass is 1.055 Earths, it takes 11.2 days to complete one orbit of its star, ...

Astronomers predict that NASA's new James Webb Space Telescope may be able to detect evidence of artificial light on the nearby exoplanet Proxima b. This study was conducted by a ...

In a groundbreaking announcement that has sent ripples through the scientific community, NASA has officially confirmed the ...

In a paradigm-shifting discovery that may redefine our knowledge of the universe, NASA's James Webb Space Telescope (JWST) has released ...

The closest known exoplanet to Earth is Proxima Centauri b, which is still close to four light-years away, approximately 23.5 trillion miles or 37.8 trillion kilometers away.

The latest breaking news, comment and features from The Independent.

OverviewPhysical propertiesDiscoveryHost starSurface conditionsPossibility of lifeObservation and explorationView from Proxima Centauri bProxima Centauri b is the closest exoplanet to Earth, at a distance of about 4.2 ly (1.3 parsecs). It orbits Proxima Centauri every 11.185 Earth days at a distance of about 0.048 AU, over 20 times closer to Proxima Centauri than Earth is to the Sun. As of 2021, it is unclear whether it has a significant eccentricity but Proxima Centauri b is unlikely to have any obliquity. The age of the planet is unknown; Proxima Centauri its...

Join us as we explore habitable exoplanets like Proxima Centauri B and KOI 5715.01, and delve into the

Proxima centauri b latest news

future of space exploration with the James Webb Space Telescope.

Astronomers are actively searching for Earth-like planets, with thousands of exoplanets now confirmed. While Proxima Centauri b is the closest rocky planet in a habitable zone, its true ...
