172 Ultimately it probably doesn't have a safe `.get` method because a dict is an associative collection (values are associated with names) where it is inefficient to check if a key is present (and return its ...

ajax jquery simple get request Asked 14 years ago Modified 6 years, 6 months ago Viewed 265k times

Is it possible to pass parameters with an HTTP get request? If so, how should I then do it? I have found an HTTP post request (link). In that example the string `postData` is sent to a webserver. I ...

From what I can gather, there are three categories: Never use GET and use POST Never use POST and use GET It doesn't matter which one you use. Am I correct in assuming those three ...

11 request.GET is the dictionary of the GET variables in the http request made to your server for example:

What is confusing you? You evidently know what `.get` invoked on a dictionary does, that's what's being called for each key in the dictionary.

The `get` keyword will bind an object property to a function. When this property is looked up now the getter function is called. The return value of the getter function then determines which property is ...

Here the `get` method finds a key entry for "e" and finds its value which is 1. We add this to the other 1 in `characters.get(character, 0) + 1` and get 2 as result.

Non-data descriptors, instance and class methods, get their implicit first arguments (usually named `self` and `cls`, respectively) from their non-data descriptor method, `__get__` - and this ...

`get` and `set` are accessors, meaning they're able to access data and info in private fields (usually from a backing field) and usually do so from public properties (as you can see in the above ...
